# Economic Impact and Return on Investment (ROI)

For architecture firms and construction contractors, the adoption of physical AI is fundamentally a financial decision.

# Financial Impacts of Physical Ai

Key Performance Indicators (KPIs) include the Utilization Rate (billable time), Overhead Rate (budget adherence), and Net Multiplier. Physics-based automation directly impacts these numbers by:

- Shortening Estimation Cycles: Physical Ai can read drawing videos and identify lessons learned.
- Reducing Rework: By catching errors early, firms reduce expensive rework caused by misinterpretations of design intent.
- Lowering Overhead: Automated monitoring reduces the burden on senior staff, and makes junior staff stronger, optimizing the Multiplier.

| **Architecture KPI** | **Potential** | **Impact of Physical AI** |
|---|---|---|
| Utilization Rate | 61% | Increases through automation |
| Overhead Rate | 162% | Decreases via reducing knowledge loss density |
| Net Multiplier | 3.0+ | Increasing by giving everyone veteran architect knowledgebase |
| **Profit Margin** | **10% - 20%** | **Protected by saving knowledge and delays** |

# Automation ROI Calculation

**The ROI of automation in the construction industry typically ranges from 200% to 400% with payback periods of 6 to 18 months**.

## Competitive Landscape and Market Position

The current market for construction technology is divided between project management platforms ), reality capture tools, and specialized QA/QC software. Glimmary's physics extraction from video occupies a unique niche within this ecosystem. **It can do the most important thing that none of these tools can, saves and provides the knowledge of a veteran architect.**

## Progress Tracking vs. Physical Intelligence

Current 360 camera options allow users to see "what is behind walls" and flag missing materials. In contrast, Glimmary provides "physics-first-ai-first" workflows. Where a reality capture tool might show that a frame has been installed, Glimmary's analysis shows whether that frame was installed correctly.

## Conclusion: The Professional Imperative for Physical AI

In all honesty, manual observation is a major source of risk. I know because I have done Construction Administration. The ability to move from visual evidence to physical proof allows firms to maintain a definitive record of their work. Furthermore, as projects complete, the knowledge learned no longer leaves with the architect.

Glimmary provides a scalable solution with three tiers.

- Simple tier: a simple prompt based solution that provides text out.
- Thoughtful tier: a more complex technical white paper explaining root cause analysis.
- Pro tier: a technical whitepaper, and infographics that transform project outcomes into permanent organizational knowledge.

Simple Cost Model. $5.99 a year subscription fee per user, and a "pay for what you use" token model.

We provide a token tabulator in the web app to eliminate surprises.
A quick reference, a 60 second video on the simple tier is roughly 60 cents.
A quick reference, the tiers are the token cost with a 1x, 2x, and 3x multiplier.
All tiers come with an API key for bulk uploads.

**By capturing physical truth at the source, the industry can finally bridge the gap between design and reality.**
